Dear Vet Friends and Colleagues,

As a specialist in cardiology, I often encounter cases that involve the heart and its related structures. It is crucial to ensure that the patient’s cardiovascular health is maintained and monitored closely. I believe that regular check-ups and proper treatment are essential in maintaining a healthy heart.

Mona, a Labrador with a seriously big heart

Lena Brown, a 7-year-old Labrador, was brought to the VSH Hospital with symptoms of heart murmurs and swelling in her legs. Dr. Maria Kelger, our cardiologist, was consulted to assess Lena’s condition. It was discovered that Lena had a heart murmur, a condition that can be caused by a variety of factors such as congenital defects or valve disorders. Dr. Kelger recommended that Lena undergo an echocardiogram to determine the cause of the murmur.

Echocardiography is a non-invasive imaging technique that utilizes ultrasound waves to create a detailed image of the heart. The test helps to identify any structural abnormalities, such as heart valve defects or other disorders. Lena’s echocardiogram results showed a normal heart structure, indicating that the murmur was not due to a structural defect.

PDP QUIZ: What do you think about the two images below?

CARDIOLOGY AT VSH

The expertise and dedication of our team are evident in the high-quality care we provide. Our goal is to ensure that our patients receive the best possible treatment and care. We look forward to continuing to serve the veterinary community in Hong Kong.
